Sokoban puzzle examples

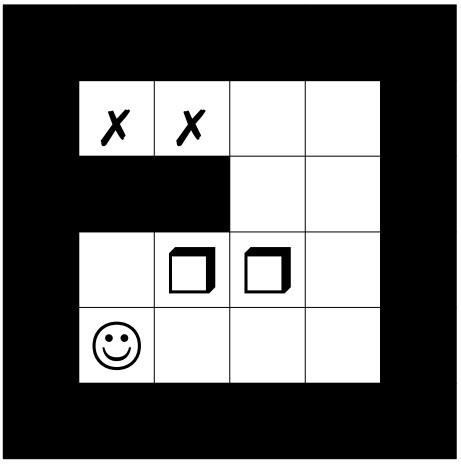

I assume that you either know the rules for Sokoban or can easily find out (they fit into two lines).

1. First puzzle *for the solver*

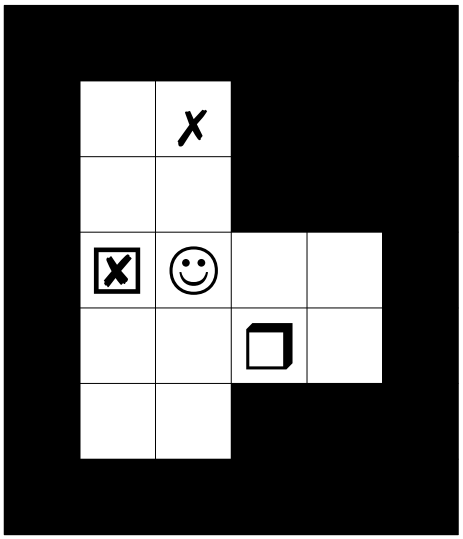

2a, 2b. First puzzle *for you* (2 variants)

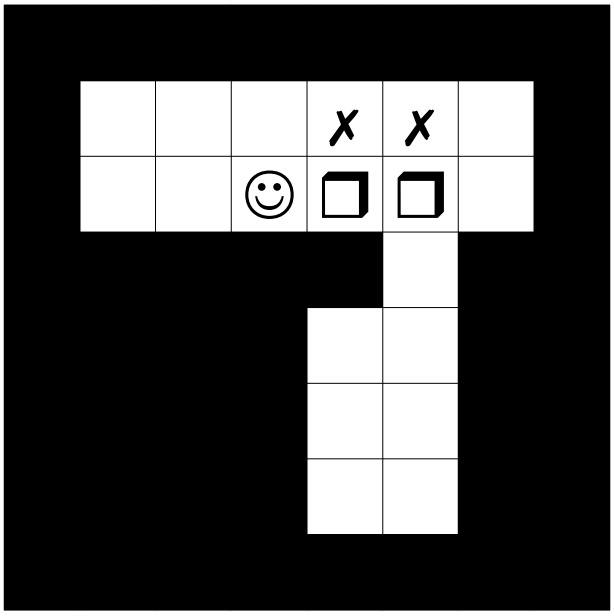

3. One of the boxes is already in place... but can be pushed away and back (or elsewhere)!

4. Bottleneck puzzle

5. Can you find a solution using planning solver? Can you find an *optimal* solution?
